1: In the part 3 I did little bit change: I think if I write add, remove, updateRSVP in the userConnection.js will be easy to manage. In order to understand the relationship better I used a tool to draw the relationship between each class.

The first picture is the Main logical:

The second logical is about the savedConnections class

2: The first stopping point is the structure of the project, I set up all the functions for each class, but when I actually implemented the UserController each function is difficult for me except the delete the connection. I think for the milestone 2 the instruction didn't provide us learning materials so it takes me so many time to search for each function and each bugs. I wish teach can provide us the similar project have similar function and we can actually learn and study instead of feel so stupid too code.

3: The second challenge is the tutor time, each slot takes 15 minutes and sometimes fixing bugs takes more than 1 hour. I think the tudor time is set up in the right way. I really wish for the next milestone teacher will provide us with more videos to let us learn and less struggle.

4: The way I finished my project take me so many time to find a project similar to my project and I watched the code about the delete, update, add function. However, some code can not apply for my project and I don't know how to fix it, so I went to my brother's house to ask him to help me in this dangerous period. From my structure of the project, I think I have better understand than before.
